

Why bottled water is the best choice

Why not be certain about what you are drinking?

The human body is 2/3 water by weight and it must replace about 2 liters each day

18.9L, Bisphenol A (BPA) free water bottles eliminate the possibility of ingesting BPA (a hardening agent used in plastics)

Only water filtered by reverse osmosis can remove Fluoride, Chlorine and Bromine from your water supply

Finally, the crisp, clean taste of bottled water can't be beat

Our Reverse Osmosis (RO) process consists of 6 stages

1. Activated carbon:

- Removes chlorine

2. Water softener:

- Removes calcium and magnesium

3. One micron particle filtration:

- A high capacity sediment filter for the removal of extremely small particles of clay, dust, mold, pollen, sand and organic debris

4. Reverse osmosis membrane:

- The pretreated water is then forced through the semi-permeable membrane. Particles 1/100,000 of a micron are removed. This is equivalent to a particle that is smaller than one millionth the diameter of a human hair

5. Ultraviolet light:

- Kills bacteria, parasites and viruses

6. Ozone:

- This is the final step in ensuring top quality taste and purity. This process is done by means of injecting ozone into the water. Ozone over several hours reverts to pure oxygen ensuring bacteria free water
